

Global Warming — Essays & Paragraphs

50-Word Paragraph

Global warming means the Earth is getting hotter. It happens because of smoke, pollution, and cutting down trees. This melts ice at the poles and makes the sea rise. The weather also becomes strange. We can stop it by planting trees, saving electricity, and keeping our environment clean.

100-Word Paragraph

Global warming means our Earth is getting warmer every day. It happens because we are making the earth too hot with smoke, cutting trees, and using much electricity. The sun shines on the Earth, and some heat stays in the air to keep us warm. But when we cut down many trees and make a lot of smoke from cars and factories, smoke gets trapped in the air. This heat makes the weather strange, melts ice at the North and South Poles, and makes the sea rise. We can stop global warming by planting more trees, saving electricity, and taking care of our planet.

150-Word Paragraph

Global warming means the Earth is getting hotter every year. The main reason is pollution, smoke from cars and factories, and cutting down trees. Harmful gases like carbon dioxide trap heat in the air. Because of global warming, the whole world is facing problems. The weather is changing. Some countries have hot summers, while others have heavy rain and floods. Ice in the North and South Pole is melting fast, and sea levels are rising. This is dangerous for people living near the sea. Global warming also harms animals, plants, and crops. Many animals are losing their homes. Farmers cannot grow enough food. People also face health problems like heat and diseases. We can help by planting trees, saving electricity and water, using less plastic, and keeping our environment clean. If all countries work together, we can save our Earth for the future.

200-Word Paragraph

Global warming is the increase in Earth's temperature. It happens because of pollution, smoke from factories and cars, and cutting down forests. Gases like carbon dioxide stay in the air and trap heat from the sun. This problem is affecting the entire world. The climate is changing in every country. Summers are becoming hotter, and winters are becoming unpredictable. Glaciers and ice in the Arctic and Antarctic are melting quickly. Because of this, sea levels are rising and many coastal cities are in danger of flooding. Global warming also affects nature. Wild animals are losing their homes. Some animals and birds are becoming extinct. Crops are getting damaged due to droughts and floods, so food is becoming expensive. People's health is also

affected. Heat waves, new diseases, and shortage of clean water are common problems now. Poor countries suffer the most from global warming because they cannot afford clean water, medicine, or ways to fight climate change. But we can still fix this. We should plant more trees, use solar and wind energy, save water and electricity, and reduce waste. Every person, school, and government must take action. If we work together now, we can make the Earth cleaner, safer, and better for the next generation.

Two Facts About Global Warming

1. Global warming is making the Earth hotter because of smoke, pollution, and cutting trees.
2. It is melting ice at the poles and making sea levels rise.
